

TruthTree Future Updates

1. Remove jumpiness of search bar.
 1. Bring search bar back to the explore page.
2. Include population size in search result weight.
 1. When searching “Boston”, there is no reason that Boston, Indiana should come before Boston, Massachusetts.
3. Remove “city” and “town” from each of the municipal data points where city or town is not actually in the name of the location.
 1. “Boston city” should just be “Boston”
4. Only the attributes that contain values for the selected location and year combination should appear in the sidebar.
 1. If Boston doesn’t have a value for “Totals - Construction” for the year 2016, then it shouldn’t be an option to select from.
 2. If the user changes the year, then the list should refresh showing the attributes that have values for that location for the newly selected year.
5. Make the table view header (“Name”, “Population”, etc..) sticky (scrolls with the user)
6. Convert checkboxes in location selection panel of timeseries view to Multiselect dropdown option to save some space
7. In Advanced search option, on hover of location in the result list should highlight markers on the map
8. Displaying extent of similarity in Advanced search. For example, if top 3 results are extremely similar, giving them a hot red color code to indicate how much they are similar to the location of interest as compared to other locations in the result list.
